

Encaplock Dust Sealing System

The patented ENCAPLOCK dust sealing system utilises sturdy locking rails which are bolted to the screen body as opposed to welding. This ensures no stress points on the side plates that can facilitate cracking in certain circumstances.

The dust cloth is then locked in to position using a flexible locking strip to secure it, even with the rigors of operation and shut down the dust cloth will not be dislodged ensuring a dust tight seal at all times. The locking strip can easily be removed by using a screw driver to lift first piece and then it peels out without further aid from tools. This makes it very maintenance friendly as skilled labor is not required for fitment or removal.

Weld on locking strips are available for static structures if required where access is limited for bolting.
