

K-Impact Belt Support System

Transfer Point Load Containment

The **K-Impact Belt Support System** can dramatically improve material containment at high impact conveyor transfer points. Each cradle is custom engineered to suit a variety of heavy material applications. The rigid cradle provides extra support under the moving conveyor belt, stabilising the load at the transfer point. The skirting and seals can then work more effectively, **preventing spillage** which creates unnecessary maintenance and labour costs.

A key feature of the **K-Impact Belt Support** is that it has no moving parts to fail and therefore is free of continual maintenance. The 12mm thick UHMW polyethylene wear surface allows the belt to slide freely over the cradle surface. The cradle is designed to interchange with existing idlers to maintain the same belt height.

The K-Impact Slider Bars form a continuous seal and protect the belt from early failure due to pinch point damage. The smooth curved trough supports the belt over the entire surface, **preventing conveyor belt punctures and tears**.

Key Design Features:

- No moving parts
- Energy absorbing Impact Bars
- Modular design
- Fire Retardant Anti Static (FRAS) available
