

Belt Tracking Solutions

For various reasons conveyor belts wander or mistrack. In other words, guiding does not eliminate the true reason for the belt tracking off centre and it is advisable to examine the root cause of the problem. By examining the cause this may limit the chance of the belt riding over the side guide roller and causing further belt damage.

Therefore, ideally belt tracking / alignment devices should be used in conjunction with the correct transom bracket or a pivoting, self-centralising, belt training system, which rotates freely when the belt experiences mistracking behaviour.
